

Process Management:

Process management is an essential aspect of linux administration. Here's an overview of some important command:-

1.) Viewing Processes

a.) ps

The 'ps' command provides a snapshot of the currently running process on the system.

```
(suman@suman)~[~]
$ ps
  PID TTY          TIME CMD
 1381 pts/0        00:00:00 zsh
 16409 pts/0        00:00:00 ps
```

Let's breakdown the output:-

- PID (Process ID) : unique numerical identifier for each process.
- TTY : Terminal type associated with process
- Time : total accumulated CPU time consumed by the process.
- CMD: the command that started the process.

b.) top

The 'top' command displays information about system resources and currently running process.

```
(suman@suman)~[~]
$ top
top - 17:52:21 up 33 min,  1 user,  load average: 1.06, 1.18, 1.12
Tasks: 284 total,  1 running, 283 sleeping,  0 stopped,  0 zombie
%Cpu(s):  2.8 us,  1.7 sy,  0.0 ni, 94.5 id,  0.6 wa,  0.0 hi,  0.5 si,  0.0 st
MiB Mem : 15734.3 total,  9869.8 free,  4412.2 used,  2683.1 buff/cache
MiB Swap:  977.0 total,  977.0 free,  0.0 used. 11322.1 avail Mem

  PID USER      PR  NI   VIRT   RES   SHR  S  %CPU  %MEM    TIME+  COMMAND
 889  root       20   0 1706452 122184 74868  S   6.0   0.8   1:59.52 Xorg
6396  suman      20   0 1133.7g 380192 149240  S   4.3   2.4   3:14.22 chrome
1279  suman      20   0  11.5g 417728 207284  S   3.7   2.6   1:57.34 firefox-esr
2130  suman      20   0  32.7g 392712 214784  S   2.3   2.4   1:34.79 chrome
```

Let's breakdown of this output:-

❖ System Information:

- Uptime: '17:52:21 up 33 min' : The system has been up and running for 33 minutes.
- User: '1 users' : There is one user currently logged in.
- load average: '1.06, 1.18, 1.12' : The load average represents the average number of processes in the run queue over the last 1, 5 and 15 minutes

- ❖ Overall cpu usage:
 - '2.8% us' : User space CPU usage.
 - '1.7% sy' : System (kernel) CPU usage.
 - '0.0% ni' : Nice priority user processes.
 - '94.5% id' : Idle cpu time.
- ❖ MIB Mem:
 - '15734.3 total' : total physical memory
 - '9869.8 free' : Free physical memory
 - '4412.2 used' : used : used physical memory.
 - '2683.1 buff/cache' : memory used for file system buffers and cache.
- ❖ MIB Swap:
 - '977.0 total' : Total swap space
 - '977.0 free' : free swap space
 - '0.0 used' : used swap space.
 - '11322.1 avail Mem' : Available memory.
- ❖ Process Table:-
 - Task: '284 total' : total number of processes.
 - Running: '1 running', Sleeping: '283 sleeping', Stopped: '0 stopped'.
 - Zombie: '0 zombie'.
- ❖ Process List:-
 - PID : Process ID.
 - USER : User who owns the process.
 - PR : Priority.
 - NI : Nice value.
 - VIRT : Virtual memory used.
 - RES : Resident memory used.
 - SHR : Shared memory used.
 - S : Process state (R: Running, S: Sleeping, Z: Zombie, etc.).
 - %CPU : Percentage of CPU usage by the process.
 - %MEM : Percentage of RAM usage by the process.
 - TIME+ : Total CPU time consumed by the process.
 - COMMAND: Command that started the process.

Here are a few highlighted processes:-

- **Xorg**: The X server, responsible for handling graphical displays.
- **chrome**: Google Chrome browser process.
- **firefox-esr**: Firefox browser process.

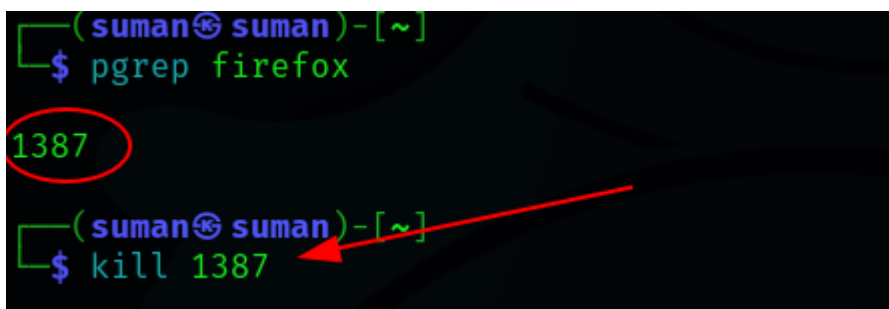

2.) Killing Processes

a.) kill :-

The 'kill' command in Linux is used to send a signal to a process, typically to terminate it. We can use it by specifying the Process ID (PID) of the process you want to terminate, like this: kill 1234

For example: if we have to kill firefox which has pid "1387":-

sudo kill 1357

A terminal window with a dark background. The prompt is (suman@suman)-[~]. The first command is \$ pgrep firefox, which outputs 1387. The number 1387 is circled in red. The second command is \$ kill 1387, with a red arrow pointing from the circled 1387 to the command.

```
(suman@suman)-[~]  
$ pgrep firefox  
1387  
(suman@suman)-[~]  
$ kill 1387
```

Package Management:

Package management on Linux involves the installation, upgrading, configuration and removal of software packages. Different Linux Distributions use different package management systems. Here are some common package management tools for Debian distribution.

APT:-

APT is the package management command-line tool used in Debian-based Linux distributions, including Ubuntu. Here are some common apt commands:

- Updating package lists:-
sudo apt update
- Upgrading Installed packages:-
sudo apt upgrade
- Installing a package:-
sudo apt install <package name>
- Removing a package:
sudo apt remove <package name>
